

Editorial to the third issue of International Journal of Geoscience, Engineering and Technology

We present the third edition of the International Journal of Geosciences, Engineering and Technology.

In this edition, we selected articles with multidisciplinary characteristics that contribute to the advancement of science, the environment, and technology.

The first article presents a discussion on Biomass to study the adsorption reactions of residues discharged in industrial effluents and the impact emitted by eliminating contaminating residues.

Some works have investigated pathologies in bridges, buildings and building safety. Other articles present monitoring of the electrical resistivity of concrete using Arduino, the survey of geological and environmental risk areas, and results of water quality analysis were also presented.

The International Journal of Geosciences, Engineering and Technology is an interdisciplinary journal of the Graduate Program in Technology, Environment and Society of the Federal University of Vales do Jequitinhonha and Mucuri (PPGTAS/UFVJM).

Only with scientific research will societies achieve future development.
